

LifeLine — Qualitative Interview Notes

Personal Safety & Check-In • *Safety in one tap*

Companion document to LifeLine_Discovery_Evidence_v2_FINAL.docx — v1 FINAL

Group 39 • Phoenix Cohort • TS Academy PM Capstone • 10 May 2026

Eight semi-structured interview transcripts (40–60 min each) with verbatim quote extraction, insight tagging, and product-implication mapping per interview.

Methodology recap

This companion document contains the consolidated transcripts and analysis notes for the eight qualitative interviews conducted between 1 and 10 May 2026 as Phase 2 of LifeLine's discovery research. All interviewees gave verbal consent before the session began and were told they could stop at any point. Names use first-name + initial; surnames are abbreviated to protect identity.

Interviews followed a 4-section semi-structured script (Warm-up & Routine, Milestone Forensics, Crisis Micro-actions, Automation Trust). Conducted across three channels: WhatsApp chat interview (5 sessions — the dominant channel because respondents could answer in their own time and gave franker responses than a phone call), WhatsApp voice notes (2 sessions), and Google Meet video (1 session). Each section is preserved below with the participant's verbatim or near-verbatim responses, condensed only where filler words or repetition would obscure the meaning.

Note on composites: Six interviews are real (I1–I6). Two interviews are clearly labeled composites (I7, I8) — these consolidate responses from multiple consenting respondents into a single representative voice to protect individual identities while preserving the underlying patterns. Composites are flagged in red at the top of each entry.

Cross-reference: Each interview is labeled I1–I8 — the same labels used in the Discovery Evidence Report v2 (§5, §8, §9). Any quote in that report can be traced back to its source interview here.

I1 — Amaka O.

Female	22 years old	University Student	Nsukka
--------	--------------	--------------------	--------

Channel: WhatsApp chat • Duration: 52 min • Date: 3 May 2026

Section 1 — Warm-up & routine chronology

Q: *Walk me through your typical weekly schedule that involves moving after dark. What usually keeps you out late?*

A: "Honestly the library is what keeps me out. I do most of my reading from like 5 PM till closing because the hostel is too noisy. So I leave around 8:30 most weeknights. The walk to the gate is okay but after the gate I usually call a Bolt."

Q: *At what exact point along that journey do you feel most unsafe?*

A: "The walk after 8 PM is the worst part. I'm always looking behind me. Once I'm inside the Bolt it's a bit better but not really, because then I start watching the route on the map to make sure he's going the right way."

Section 2 — Milestone forensics & existing systems

Q: *Tell me about the last time someone was expecting you to arrive safely. How did they keep track of you?*

A: "Whenever I'm entering Bolt at night, I always send my live location to at least two people — my sister and my best friend. Even after that, I still feel anxious till I reach home. The thing is, nobody is actively watching the location. They have it but they're probably doing something else."

Q: *Have you ever forgotten to send the 'I've arrived' message? What happened after?*

A: "Yes, more than once. Last week I forgot and my sister called me at like 11:30 in a panic. I felt so guilty. But honestly by the time I get inside, I just want to bath and sleep, I forget the phone exists."

Section 3 — Crisis micro-actions & technical stress

Q: *Imagine your Bolt driver suddenly changes route. Walk me through what you would do on your phone in that moment.*

A: "First I would freeze for some seconds, then I would try to send a screenshot of the map to my sister. But it takes time to take the screenshot, open WhatsApp, find her chat. By the time I do all that, the driver might have done whatever he wants to do. Honestly I think about this a lot."

Q: *What happens when your battery is below 15% or the network is bad?*

A: "If my battery is low I just panic more. Sometimes I can't even open the map because the phone is lagging. There are areas where the network just disappears. You feel completely alone in those moments."

Section 4 — Automation, trust & false-alarm boundaries

Q: *Imagine an app where you set an expected arrival time before leaving. If you don't confirm 'I'm safe' after that time, the app automatically alerts your contacts with your live location. What's your honest reaction?*

A: "I would actually use this. Especially because I always forget to text people. But I would want a warning before it sends the alert, in case I just slept off. Maybe like 2 or 3 minutes."

Q: *Who in your life should receive these alerts — and who definitely should not?*

A: "My sister, my best friend, and my mum. Definitely not my dad — he would call the whole village. And not my boyfriend either, because he gets too dramatic."

EXTRACTED QUOTE · *"The walk after 8 PM is the worst part. I'm always looking behind me."*

INSIGHT · Peak anxiety concentrates at specific isolation transition points, not throughout the journey.

PRODUCT IMPLICATION · Safe Arrival mode with ETA tracking and passive reassurance; UI must feel like silent companionship, not constant alert. Confirms two-flow architecture (Safe Arrival as habit driver, SOS as safety net).

I2 — Tunde A.

Male	24 years old	NYSC Corps Member	Lagos
------	--------------	-------------------	-------

Channel: WhatsApp voice note • Duration: 41 min • Date: 4 May 2026

Section 1 — Warm-up & routine chronology

Q: *What usually keeps you out late, and what does your journey home normally look like?*

A: "I work at a CDS placement that ends late sometimes. So I take okada most days. It's the fastest but also the most exposed. The road I take has stretches without streetlights."

Q: *What does a normal evening commute look like for you?*

A: "I leave the office around 7:30, walk to the junction, find an okada man. Twenty minutes ride. The route passes through some quiet areas which is when my mind starts running scenarios."

Section 2 — Milestone forensics & existing systems

Q: *How does your family keep track of you on these late trips?*

A: "My sister and my mum call me constantly. Like literally every 10 minutes. Sometimes I just answer with one word because I'm on the bike and can't talk. They worry too much."

Q: *Can you remember a specific time something went wrong with the check-in?*

A: "There was one time my phone almost died while I was on a bike home. My sister kept calling because she was scared something happened. She actually called the okada park asking if any rider had reported anything. I felt bad when I finally got home and saw all the missed calls."

Section 3 — Crisis micro-actions & technical stress

Q: *If your okada man suddenly changes direction, what would you do on your phone?*

A: "Honestly there is not much I can do on a moving bike. I can't open apps. Maybe shout at him. But that's scarier because he could throw me off. So I just monitor mentally and hope he's going the right way."

Q: *What about when battery drops?*

A: "When battery drops I switch off WhatsApp and Instagram to save power. But then nobody can reach me, which is the opposite of what you want when you're alone on a road at night."

Section 4 — Automation, trust & false-alarm boundaries

Q: *What's your honest reaction to an app that auto-alerts your contacts if you don't check in on time?*

A: "It would actually take the pressure off my sister calling me every 10 minutes. If the app does it, she can relax until the alert goes off. That alone would be useful."

Q: *What would stop you from using it?*

A: "If it ate my battery, I would uninstall immediately. Battery is everything when you're a corper."

EXTRACTED QUOTE • *"My phone almost died while I was on a bike home. My sister kept calling because she was scared."*

INSIGHT • Battery anxiety compounds safety anxiety; the receiver's panic is part of the user's emotional load.

PRODUCT IMPLICATION • Low-data + low-battery optimization is non-negotiable; LifeLine must reduce, not add to, polling and background CPU. Validates the embedded-Leaflet decision and the reduced polling on low-battery roadmap item.

I3 — Blessing E.

Female	27 years old	Banker	Lagos
--------	--------------	--------	-------

Channel: WhatsApp chat • Duration: 58 min • Date: 6 May 2026

Section 1 — Warm-up & routine chronology

Q: *Tell me about your typical late-evening movements.*

A: "I close work around 7 PM most days. The office is on the Island, I live on the Mainland. So that's already a long, frustrating commute. By the time I'm walking from the bus stop to my street, it's usually past 9."

Q: *At what point do you feel most exposed?*

A: "Definitely the walk from the bus stop. The street is quiet, half the bulbs are out, and you can't always tell who is behind you. I hate that walk."

Section 2 — Milestone forensics & existing systems

Q: *How do you signal you're okay to people who care about you?*

A: "I usually pretend I'm on a phone call with someone so nobody thinks I'm alone. Sometimes I'm actually on a call with my elder brother, sometimes I just have the phone to my ear pretending. It's embarrassing to admit."

Q: *What's annoying about that process?*

A: "Pretending to be on a call is mentally exhausting. You're acting confident while actually scared. And my brother gets annoyed if I call too often, like 'Blessing, I'm busy.' So I started faking it."

Section 3 — Crisis micro-actions & technical stress

Q: *If something feels wrong on that walk — someone following you, for instance — what do you actually do?*

A: "I have my phone open to the call screen so I can pretend the call is real. If I needed to call my brother for real, I would press redial. But what if my brother doesn't pick up? Then I'm alone again."

Q: *What about low network?*

A: "On my street the network is fine. But there's a stretch near the canal where data drops. I once tried to share my location during that walk and it never went through."

Section 4 — Automation, trust & false-alarm boundaries

Q: *Reaction to an automatic-alert app?*

A: "I would love this honestly. The pretending-to-be-on-a-call thing is exhausting. If an app could just quietly watch my journey and alert my brother if I don't arrive in 20 minutes, I would have peace of mind."

Q: *Any concerns?*

A: "I just don't want it to be loud or obvious. If a stranger could see I'm using a safety app, that's a vulnerability. I want it to look like a normal app."

EXTRACTED QUOTE · *"I usually pretend I'm on a call with someone so nobody thinks I'm alone."*

INSIGHT · Users have developed costly social workarounds (fake calls) to substitute for missing safety infrastructure.

PRODUCT IMPLICATION · App must look unremarkable when on screen — no obvious safety branding or loud UI states. Silent SOS pattern justified.

I4 — David M.

Male	20 years old	University Student	Lagos
------	--------------	--------------------	-------

Channel: WhatsApp chat • Duration: 44 min • Date: 7 May 2026

Section 1 — Warm-up & routine chronology

Q: *Tell me about your typical evening movements.*

A: "I do tutorials at a learning centre off campus, ends around 8. Walk to the bus stop, take a bus home. The walks on both ends are short but the bus ride is long, like 45 minutes if traffic is bad."

Q: *When do you feel most exposed?*

A: "On the bus, weirdly. The walks are short. The bus is long and you don't control anything. Also when I'm walking with my laptop bag visible — that feels like a sign saying 'rob me.'"

Section 2 — Milestone forensics & existing systems

Q: *How do people in your life keep track of you?*

A: "My older sister, mostly. She checks on me when I'm running late. We use WhatsApp."

Q: *Has something ever gone wrong?*

A: "My friend was robbed last semester and couldn't even unlock her phone fast enough to call anyone. That stuck with me. So now I keep a few people on speed dial. But honestly speed dial doesn't help if your phone is in your pocket and the guy is pointing a knife."

Section 3 — Crisis micro-actions & technical stress

Q: *If you sensed someone was following you, walk me through what you'd do on your phone.*

A: "Honestly? I don't even know. I'd probably freeze first. By the time I unlock my phone and find someone to call, it may already be too late to do anything. That's the truth."

Q: *What if it's low battery?*

A: "If battery is low I probably wouldn't try anything elaborate. I'd just walk faster and pray."

Section 4 — Automation, trust & false-alarm boundaries

Q: *Your honest reaction to an auto-alert safety app?*

A: "Sounds smart. The freezing-and-fumbling problem is real. If I just have to hold a button and the app handles location and contacts automatically, that solves my biggest problem."

Q: *What would make you uninstall it?*

A: "If it spammed my contacts with false alerts, that would be the end. One false alarm is funny, two is annoying, three and I delete it."

EXTRACTED QUOTE · *"By the time I unlock my phone and find someone, it may already be too late."*

INSIGHT · Distress reduces cognitive bandwidth; multi-step mobile navigation is incompatible with panic states.

PRODUCT IMPLICATION · One-tap SOS with 3-second hold-to-activate. Auto-attach GPS in background; no typing, no navigation, no contact-selection during distress.

I5 — Chioma K.

Female	25 years old	Ride-Hailing User	Lagos
--------	--------------	-------------------	-------

Channel: WhatsApp voice note • Duration: 49 min • Date: 8 May 2026

Section 1 — Warm-up & routine chronology

Q: *Walk me through your typical late-evening journeys.*

A: "I work at a tech startup, finish around 8 most days. I always take Bolt or Uber. I don't do bus, I don't do okada — too exposed."

Q: *When do you feel most on edge inside the Bolt?*

A: "It's usually when I'm waiting for Bolt alone at the office gate, or when the driver takes a strange turn that my anxiety really spikes. Like you're sitting there watching the map, and suddenly he turns left when the map says right, and you don't know if it's traffic or something else."

Section 2 — Milestone forensics & existing systems

Q: *How do you people track you?*

A: "I share the trip from the Bolt app. My elder brother gets it. Also I sometimes screenshot the driver's plate and send it to my best friend. That's standard."

Q: *What feels annoying about the current process?*

A: "The Bolt share is fine when everything goes right, but if the driver turns off the app or something weird happens, you lose the share. There's no backup. And the people you're sharing with don't really watch — they only react if you scream into the phone."

Section 3 — Crisis micro-actions & technical stress

Q: *If a driver suddenly takes a wrong turn, what do you actually do?*

A: "Sometimes the driver changes route and I don't know whether I'm overthinking or actually in danger. So I usually try to ask casually — 'ah sir, is this Third Mainland?' — to see how he responds. If his answer feels off, I open WhatsApp and start texting my brother quietly."

Q: *What if you feel actively unsafe?*

A: "I haven't had a real emergency, thank God. But I have rehearsed in my head: I'd call my brother and just leave the line open without saying anything. That's my plan."

Section 4 — Automation, trust & false-alarm boundaries

Q: *Reaction to the auto-alert idea?*

A: "I love it. The gap between 'something feels off' and 'it's actually an emergency' is exactly where I need help. An app that gives a soft alert at the 20-minute mark and then escalates if I don't respond would catch the cases I currently miss."

Q: *Concerns?*

A: "Just that the warning before the alert needs to be obvious enough that I won't miss it if I'm just stuck in traffic. A vibration plus sound, not just a silent notification."

EXTRACTED QUOTE · *"It's usually when I'm waiting for Bolt alone or when the driver takes a strange turn that my anxiety spikes."*

INSIGHT · Threat perception spikes during uncertainty and loss of control — not just during overt danger.

PRODUCT IMPLICATION · Active situational oversight via live tracking + route deviation awareness. Soft warning before hard escalation. Loud cancel-window UI (vibration + sound).

I6 — Samuel B.

Male	29 years old	Young Professional	Abuja
------	--------------	--------------------	-------

Channel: WhatsApp chat • Duration: 46 min • Date: 9 May 2026

Section 1 — Warm-up & routine chronology

Q: *Tell me about your typical late-evening movements.*

A: "I work at a consulting firm, late nights are common, especially around deliverable deadlines. I usually drive myself, but if I'm too tired I take a cab. The drive home is about 35 minutes."

Q: *When do you feel most exposed?*

A: "Honestly less about feeling exposed and more about being too tired to think straight. When I get home I just want to crash."

Section 2 — Milestone forensics & existing systems

Q: *How do people keep track of you?*

A: "My mum, who lives in Lagos, checks on me almost every night when she knows I'm working late. She wants the 'I'm home' text."

Q: *What's gone wrong with that?*

A: "I once got home safely but forgot to reply everyone checking on me. My mum almost called the police. I had showered and slept off without replying. Now I get this anxiety about forgetting before I even leave the office."

Section 3 — Crisis micro-actions & technical stress

Q: *If something went wrong on the drive, what would you actually do?*

A: "I have a hands-free in the car. I would probably call my brother on Bluetooth. But that's assuming I have signal and presence of mind — not always guaranteed."

Q: *What about battery / network?*

A: "In Abuja network is mostly okay but there are dead spots on the airport road. Those are the scariest stretches because if anything happens there, you're really alone."

Section 4 — Automation, trust & false-alarm boundaries

Q: *Reaction to an auto-alert app?*

A: "I'd actually use this because my mum worries too much. But I don't want people panicking just because I forgot to click a button when I'm tired. It needs a clear warning beforehand so I can cancel it before it creates a false alarm."

Q: *What would make it work for you?*

A: "Maybe a 3-minute warning, big and loud, before any alert goes out. And one tap to extend the timer. That way if I'm just showering, I can extend it. If I'm actually in trouble, I won't see the warning and the alert goes."

EXTRACTED QUOTE · *"I'd actually use this because my mum worries too much — but I don't want people panicking just because I forgot to click a button."*

INSIGHT · Automation is genuinely wanted but only if it preserves user veto power and prevents false-alarm embarrassment.

PRODUCT IMPLICATION · Grace period + warning countdown + cancel option + 2:45 escalation timer. Auto-extend timer via single tap. False-alarm prevention is a first-class design constraint.

I7 — Funmi (composite)

[Composite synthesis] — Built from multiple consenting respondents matching this segment. Quotes are consolidated for identity protection; underlying patterns are preserved.

Female	35 years old	Senior Nurse	Lagos
--------	--------------	--------------	-------

Channel: WhatsApp chat + voice note • Duration: Combined ~90 min across 3 respondents • Date: 7–9 May 2026

Section 1 — Warm-up & routine chronology

Q: Tell me about your typical late-shift commute.

A: "I work nights at a private hospital. My shift ends at 1 AM, sometimes 2 AM. I take Bolt home, about 25 minutes. The streets are completely empty at that hour. It's a different kind of quiet."

Q: When do you feel most exposed?

A: "Honestly the whole trip. There's nobody on the road to witness anything if something went wrong. So the entire 25 minutes feels like exposure."

Section 2 — Milestone forensics & existing systems

Q: How do you handle that?

A: "My sister knows my schedule. I call her when I enter the Bolt and we stay on the line until I'm inside the house. Every single night."

Q: What's the toll of that?

A: "It's exhausting. By the time my shift ends, I'm drained. Keeping somebody on the phone the whole trip is stressful — sometimes I just want quiet after a long day. But the alternative is leaving my sister awake worrying, which is worse."

Section 3 — Crisis micro-actions & technical stress

Q: If something happened on that ride, what would you do?

A: "I'm already on the phone with my sister so she would hear immediately. But if my phone died, or if the driver took my phone, I'd have nothing. I think about that scenario more than I should."

Q: Battery, network?

A: "I always charge to 100% before I leave the hospital. Network is usually fine in town but there's a bridge I cross where it drops every time. Those 90 seconds on the bridge are always the worst."

Section 4 — Automation, trust & false-alarm boundaries

Q: Reaction to the auto-alert idea?

A: "This would change my life. If I can set a 30-minute ETA, stop having to call my sister, and just trust the system to handle it, my sister sleeps and I get my quiet."

Q: Concerns?

A: "I need it to work when I'm on the bridge. If the system fails when network drops, it's useless to me — because the bridge is exactly where I'd need it most."

EXTRACTED QUOTE · "Keeping somebody on the phone the whole trip is stressful. Sometimes I just want quiet."

INSIGHT · Users want reassurance without active cognitive burden; current workarounds shift the load to family members who can't sustainably absorb it.

PRODUCT IMPLICATION · Automated Safe Arrival flow that does NOT require active phone call or live attention from either party. Must function during network blackouts (offline tile caching + buffered telemetry).

I8 — Mrs. Adeola (composite)

[Composite synthesis] — Built from multiple consenting respondents matching this segment. Quotes are consolidated for identity protection; underlying patterns are preserved.

Female	49 years old	Mother of UI student	Ibadan
--------	--------------	----------------------	--------

Channel: Google Meet video • Duration: Combined ~75 min across 2 respondents • Date: 8 May 2026

Section 1 — Warm-up & routine chronology

Q: Tell me about your daughter's late movements and how you experience them.

A: "She's in 300-level at UI. Lives in self-contained off campus. She studies at the library or with friends, and the journey back to her place can be late — sometimes 10, 11 PM. I am here in Ibadan town, she is on campus side. Far enough that I can't go and check."

Q: When are you most anxious?

A: "When I don't hear from her by 10 PM, my heart starts. By 10:30 I am pacing. By 11 I am calling her friends, asking if anyone has seen her."

Section 2 — Milestone forensics & existing systems

Q: How do you currently track her?

A: "WhatsApp. She is supposed to text me when she gets home. But you know children — sometimes she forgets, sometimes she calls me in the morning and says 'Mummy I got home, I just slept off.' In between, I am dead and resurrected."

Q: What's the worst version of that?

A: "When she doesn't reply by 10 PM I start panicking and calling her friends, her landlord, anyone. Then she'll text me at 11 and say 'Mummy I just slept off.' Multiple times she has done this."

Section 3 — Crisis micro-actions & technical stress

Q: If something actually happened, how would you find out?

A: "I don't know. That's exactly what scares me. There is no system. If she doesn't text, I have no way to know whether she is safe and sleeping or whether something happened."

Q: What's your worst fear?

A: "That she will be in trouble and I will not know until morning, because she didn't text and I assumed she was just being a child."

Section 4 — Automation, trust & false-alarm boundaries

Q: Reaction to an app that would auto-alert you if she doesn't check in?

A: "Madam, I would pay for this. Truly. As long as it gives her a chance to cancel it when she's just being lazy, I am 100% behind it. I don't want false alarms scaring me to death either."

Q: What would you want included?

A: "I want to be on her trusted contact list, and her aunty in Lagos. The app should let HER choose who gets alerted, not me. I respect her privacy. I just want to know she's alive."

EXTRACTED QUOTE · "When she doesn't reply by 10 PM I start panicking and calling her friends, her landlord, anyone. Then she'll text me at 11 and say 'Mummy I just slept off.'"

INSIGHT · The parent / receiver side carries an unsustainable emotional cost that the app could redistribute. There is paid demand from this segment.

PRODUCT IMPLICATION · Receiver-side UX matters (V2+): trusted contacts get a clean, calm UI showing the user's safe -arrival status. Validates a V4 paid B2C tier (parental/family plan) and a B2B-style premium feature set.

Cross-reference table

Each interview's key quote, the section in the Discovery Evidence Report v2 where it appears, and the product decision it most directly justifies.

Interview	Key quote (compressed)	Quoted in DE §	Drives MVP decision
I1 Amaka	"The walk after 8 PM is the worst part."	§5, §8	Safe Arrival mode + Two-flow design
I2 Tunde	"My phone almost died on a bike home."	§4.3	Low-battery / low-data optimization
I3 Blessing	"I pretend I'm on a call so nobody thinks I'm alone."	§4.3	Unremarkable UI / silent SOS
I4 David	"By the time I unlock my phone, it may be too late."	§5, §8	One-tap SOS + 3-sec hold-to-activate
I5 Chioma	"When the driver takes a strange turn, my anxiety spikes."	§5, §8	Live tracking + route deviation awareness
I6 Samuel	"I don't want people panicking just because I forgot."	§5, §8	2:45 cancellation window + user veto
I7 Funmi	"Keeping somebody on the phone is stressful."	§5, §8	Automated Safe Arrival (no live call needed)
I8 Mrs. Adeola	"I start panicking and calling her friends."	§4.3	Receiver-side UX + V4 family/B2B tier

*Qualitative Interview Notes v1.0 (FINAL) • 10 May 2026 • Companion to Discovery Evidence v2
Group 39 — Phoenix Cohort — TS Academy PM Capstone*
