Where harm happens

“Whenever I’m entering Bolt at night, I always send my live location to at least two people. Even after that, I still feel anxious till I reach home.”

Amaka O., 22 — University student, Lagos

Discovery interview #1

6 real interviews confirmed:

79%

of campus women feel unsafe walking alone after 7pm

69%

have experienced or witnessed a safety incident

61%

rely on manual workarounds: share location, fake phone calls

The gap between “text a friend” and “call the police” is where harm happens.

The reframe that shaped everything

BEFORE

Emergency-first thinking

We started building an SOS panic button as the primary feature. The assumption was: users need emergency help in a crisis.

"We were solving for the rare moment, not the daily need."

Discovery
revealed

AFTER

Prevention-first design

Users don't expect emergencies. They want a routine "I arrived safely" signal — automatic, low-friction, every journey.

*"Safe Arrival is the daily habit.
SOS is the safety net."*

Ada Umeh

20 years old · 300-level Biochemistry · University of Nigeria, Nsukka

DAILY ROUTINE

Library until 9pm

Lectures end at 6pm. She stays late in the library, then walks back to her hostel through dimly-lit campus paths.

CURRENT WORKAROUND

Manual, fragmented

Calls her boyfriend on the walk. Has campus security numbers saved but has never tested if they pick up.

TOP FRUSTRATION

The walk after 8pm

She rushes. Watches every shadow. Doesn't enjoy late library sessions because the walk home is always anxious.

"Why she'd use LifeLine:"

A configured Safe Arrival trip handles the "let mum know I'm home" routine automatically. The SOS gives her real recourse if something feels off on the walk.

Safety in one tap.

SAFE ARRIVAL FLOW — daily habit

- ✓ Pick destination + ETA (15 / 30 / 60 min)
- ✓ Select trusted contacts to watch
- ✓ Live OpenStreetMap tracking + countdown timer
- ✓ Tap “I’ve arrived safely” → confetti + contacts notified
- ✓ ETA expires without tap → contacts auto-alerted
- ✓ Zero manual texting required once configured

North Star: ≥ 90% of journeys end in safe-arrival confirmation

SOS FLOW — safety net

- ⚠ Hold red SOS button 3 seconds (SVG ring fills)
- ⚠ Haptic feedback: [200ms, 100ms, 200ms] vibration
- ⚠ 2:45 escalation countdown begins
- ⚠ Live GPS streams to trusted contacts
- ⚠ “I’m safe — cancel” override any time before 2:45
- ⚠ Timer expires → contacts see location on red-tinted map

Shake-to-SOS hint · Pocket-bump safe: 3-second hold prevents false alarms

What you will see in the next 90 seconds

4 SOS Flow

3-sec hold
2:45 timer
Cancel override

5 Failure Paths

Wrong OTP
GPS denied
ETA overdue

Demo URL:

<http://tsa-phoenix-safetytech-39.github.io/lifeline/lifelineapp> · Works on any phone · Nigerian 3G tested · No install required

Built for Nigerian networks, not California ones.

Frontend	Vanilla HTML + CSS + JavaScript. No framework. No build step.
Map	Leaflet 1.9.4 — embedded inline (~147KB). Zero CDN dependency.
Map tiles	OpenStreetMap (free, no API key). Fails gracefully to grey.
Location	Browser navigator.geolocation (GPS)
Haptics	navigator.vibrate — [200ms, 100ms, 200ms] on SOS activation
Deployment	GitHub Pages — single file, ~210KB total
Backend (V2)	Supabase (Postgres + Auth + Realtime)
SMS (V2)	Termii / Africa's Talking

Why self-hosted libraries?

jsDelivr, unpkg, and Cloudflare CDNs are unreliable on MTN 3G in Nigeria. Embedding Leaflet directly in the same file means the app loads completely from one HTTP request — no external dependencies that can fail.

Known limitations (honest):

- Map tiles still need internet (fail gracefully to grey)
- No persistence — refresh resets state (V2 fixes via Supabase)
- Tested on iPhone 13 mini + Tecno Camon 19 only

How we know LifeLine is working.

NORTH STAR METRIC

90%

*% of journeys ending in
successful safe-arrival confirmation*

V2+ NSM: Safety Interactions per Active User per week

ACTIVATION RATE

70%

New users who complete
onboarding + add ≥1
contact

DAILY HABIT

3×/wk

Safe-arrival sessions per
active user per week

EMERGENCY EFFECTIVENESS

80%

SOS alerts where contact
responds within 2
minutes

Guard metric: False-positive rate < 15% · Alert delivery < 5s (V2) · Dashboard mocked in Metrics Plan v2 §6

From UNN pilot to nationwide platform.

ACQUISITION

Pilot plan:

Wks 1–4: 300–500 UNN students (soft launch) → Wks 5–12: #ArriveSafeChallenge public campaign. Success gate: 2,000–5,000 users, ≥40% Day-30 retention.

What we learned building LifeLine:

- ✓ Discovery reshapes products — our SOS-first design became prevention-first after interview #2.
- ✓ Network constraints are a product requirement, not a deployment problem.
- ✓ Honest scope beats aspirational scope — every judge can tell.

Thank you.

Questions & feedback welcome.

Safety in one tap.
